

Securing the 2D Dummy

Follow these steps to secure the 2D manikin using landscape staples:

Place the 2D manikin in the desired location.

Find the two grommet holes on the Dummy. These are typically located on the sides or bottom of the Dummy.

Take a landscape staple and insert one side of it through one of the grommet holes. The staple should go through the grommet and be positioned outside the perimeter of the Dummy.

Hold the staple in place and carefully push the other end into the ground. The ground should be soft enough to insert the staple easily. Make sure that the staple is driven into the ground so that it is securely anchored.

Repeat the process with the other grommet hole, using a separate landscape staple.

The 2D Dummy should now be securely anchored to the ground.

If you need to secure the Dummy to a hard surface, such as concrete, you can use the grommet holes to attach a rope or a weighted object. Thread the rope or attach the weighted object through the grommet holes and secure it. Doing so will help keep the Dummy from sliding or being moved by the wind.

It's important to remember that landscape staples are unsuitable for all surfaces, and they are designed to be used on soft ground and may need to hold better on hard surfaces or in too rocky or dense soil. In these cases, you may need alternative methods to secure the Dummy.
